

owens.m notes:
-The minor functions with just a few lines of code and only called once should be incorporated into owens.m and not as separate files
- Lots of parameters that should be pulled into the main analysis setup file (and their associated read-in functions removed)
- The vararg input needs to be made consistent and simplified.
- Comments need to be restructured so that it is clear which section/analysis is being conducted
- Structure should be updated to be concise, not repeating code so much

importCactusFile.m notes:
Should probably rename since it is moreso just a replacement for loaddata

transientExec note: aero section needs overhauled, multiple different flags, lots of unused code
